The genus *Pachycoleus* Fieber, 1860 (often considered a subgenus of *Cryptostemma* Herrich-Schaeffer, 1835) comprises species of very small sizes, which are rarely collected. In the European part of Russia, two species were recorded: *P. pusillimus* (J. Sahlberg, 1870) from Karelia and *P. waltli* Fieber, 1860 from Yaroslavl Prov-

ince and Kaluga. *P. pusillimus* is now collected by me in Voronezh Province: 20 km NNE of Voronezh, Usmanskiy forest, border between mixed forest and swamp meadow, in mosses, 15.VIII.2002 (13 specimens) and 3-4.IX.2003 (74 specimens from 1 m²!).
